

BROTHER ENGINEERING LTD

Metal Spraying

When mechanical wear rather than irreparable damage is the cause of the problem - it is no problem to Brother Engineering. We are able to rebuild the worn area using metal spraying techniques utilising stainless steel, nickel or bronze.

Once metal sprayed, the built-up area can then be ground or machined to very fine tolerances, in order to produce a repaired component which is often better than the original.

High load, high wear is an expensive but avoidable cost to your business. Our proven technology provides exceptionally cost-effective and **STRONGER** wear resistant solutions to the unnecessary expense and down-time caused through abrasion, erosion, corrosion or heat.
